Call of Duty 4 Modern Warfare and the PlayStation 3. Lifetime prevalence and chronicity of child and adolescent mental disorders: results from two population-based surveys. Although the lifetime prevalence of child and adolescent mental disorders (CAMDs) is well established, the pattern of chronicity is not well established. This study estimated the proportion of CAMD cases with a chronic course (i.e., two or more lifetime presentations of a disorder) and the duration of the chronic course in CAMD. Data on childhood and adolescent psychopathology from two population-based surveys with a 10-year interval were combined to form a series of historical cohorts between the ages of 14 and 12 years. All respondents were assessed on a wide range of disorders using the Schedules for Clinical Assessment in Neuropsychiatry. The stability of a case-history of disorders across the two time points was examined using conditional logistic regression. The proportion of CAMD with a chronic course was estimated using the multiple (polyserial) correlation coefficient. The average duration of a chronic case-history was calculated as the negative of the multiple correlation coefficient. The overall prevalence of CAMDs ranged from 7.7% to 11.0% in the two surveys, with no significant differences between the surveys. The proportion with a chronic course ranged from 29.0% to 33.7%. The average duration of the chronic course was 2.6 years. The results indicate that a significant proportion of CAMDs have a chronic course, with a mean duration of chronicity that is approximately two and a half years. The
